A database is an organized collection of data, generally stored and accessed electronically from a computer system. Where databases are more complex they are often developed using formal design and modeling techniques. The database management system (DBMS) is the software that interacts with end users, applications, and the database itself to capture and analyze the data.

According to database theory, a multivalued dependency is a full constraint between two sets of attributes in a relation. In contrast to the functional dependency, the multivalued dependency requires that certain tuples be present in a relation. Therefore, a multivalued dependency is a special case of tuple-generating dependency. The multivalued dependency plays a role in the 4NF database ...

The primary key and the unique key both are unique keys in a relational database that guarantee the uniqueness of the values on a column or a set of columns. There is already a pre-defined unique key constraint within a primary key constraint. While a primary key is particularly used to identify ...

I have been trying to find a good definition, and get an understanding, of what a thread really is. It seems that I must be missing something obvious, but every time I read about what a thread is, it's almost a circular definition, a la "a thread is a thread of execution" or "a way to divide into running tasks".

There are three broad concurrency control techniques, i.e. Multi-version Concurrency Control (MVCC), Strict Two-Phase Locking (S2PL), and Optimistic Concurrency Control (OCC), and each technique has many variations. In MVCC, each write operation creates a new version of a data item while retaining the old version.

As described in the official document, PostgreSQL supports a very large number of features required by the SQL standard of 2011. Query processing is the most complicated subsystem in PostgreSQL, and it efficiently processes the supported SQL. This chapter outlines this query processing; in particular, it focuses on query optimization.
